Roa makhtoob	Lina Saleh Eldin
Description is general and lacks operational details Not clear how the business operates in practice (store, field visits, etc.)	Aya Hamayel

Business Description: Solar Cell Shop in Palestine

How do customers interact with the business in reality?
Is there a physical store or only field operations?

VoltSun is a shop that sells solar cell products situated in Palestine. The primary objective of the business is to offer alternative energy sources due to the constant shortage of electricity and the high cost of electricity. The company assists individuals and firms in generating their own source of energy from solar energy sources.

The business primarily deals with the sale of solar energy products and offering services relating to installation and maintenance. This makes it a product-based and service-based business.

Services Offered

Some of the services that the business offers include:

Services are listed but not described in detail
No explanation of how each service is actually performed

1. Sale of solar panels, batteries, inverters, complete sol
2. Designing solar systems according to the requirements of the clients
3. Installation of solar systems for clients
4. provide after-sale services such as maintenance, warranty, and technical support.
5. Technical consultancy services
6. Delivery of equipment to clients
7. Payment methods such as cash and installments

Describe how each service works step by step
How is installation carried out?
How is maintenance requested and delivered?
How is consultancy provided?

Business Capacity

The store should be prepared to operate at a capacity based on its estimated level of performance depending on consumer demand and availability of renewable energy in Palestine. This will

Includes numerical estimates

depend on the extent to which Palestinians require solar power and those using solar energy within the country.

It will serve about 150 to 300 clients monthly. These would include individual families, small business organizations, large corporate companies and institutional entities.

The store will offer an estimated number of 20 to 50 types of solar products that vary in size, capacity, and technological features.

Provide exact numbers:
customers per month
installations per week
concurrent projects

install between 80 to 150 systems monthly depending on the size and complexity of

Avoid estimates and large ranges

From a perspective, apart from individuals, universities and governmental institutions in the region have shown a growing interest towards solar energy solutions. Institutions such as Birzeit university have installed solar systems in their facilities to conserve energy, save costs and improve sustainability. Most of these installations require complex installation procedures meaning that one single project requires a lot of time, resources, effort, and expertise.

The same applies to the government where some of the projects involve installing solar panel installations on various governmental structures and learning institutions. These types of projects are making a major contribution to expanding the solar energy market not only as a product but also in terms of the installations and repair services.

This therefore means that the ability of the business to perform several tasks goes beyond having customers because it must be prepared for larger projects such as those for educational institutions and the government. The solar energy business should be geared towards meeting such requirements since the solar energy market in Palestine continues to expand.

Business Process and Revenue

Only one general process is provided

1. Customer reaches out to the store (through personal visit, telephone, or the Internet)
2. Store personnel evaluate customer's electricity requirements
3. Solar system appropriate for the customer's requirement is suggested
4. Price and mode of payment are determined
5. Installation components are assembled and delivered
6. Technical team installs the solar system

Each service should have its own business process

Where are the processes for:
maintenance service?
delivery?
consultancy?

7. System is put to test to confirm its efficiency
8. Support and maintenance service is offered

Revenue sources are clearly identified
Includes both product and service income

The business generates revenue through multiple streams, including product sales, installation services, and maintenance contracts. In addition, revenue is generated from technical consultation services, delivery fees, and installment payment plans. This diversified revenue model supports the scalability and sustainability of the business.

Employees and Their Roles

In order to provide quality services, it would be best for the company to consider hiring:

- Manager (1) – overall management
- Salesmen (2-3) – communication and sales
- Engineers (2-3) – system design and supervision
- Technicians (4-6) – installation and servicing
- Quality control and maintenance staff (1-2) – follow-up
- Delivery men (2-3) – delivery of equipment

Specify exact number of employees per role
Link each role to specific business services

It will be estimated that there would be about 12-18 workers.

Users and Stakeholders

The main users of this business include:

Clearly identified and realistic user groups

- Residential households
- Commercial businesses
- Agricultural projects
- Educational institutions and universities
- Government organizations

Marketing and Customer Awareness

Provides useful information
However, it is not essential for business definition
Contains general statements

The business will use multiple marketing strategies to ensure that customers are aware of its services and products. Social media platforms such as Facebook and Instagram will be used to promote solar energy solutions, share offers, and educate customers about the benefits of

renewable energy. A simple website will also be created to display available products, services, and contact information.

In addition, the business will rely on word-of-mouth marketing through satisfied customers, which is considered one of the most effective methods in the local community. Printed advertisements, banners, and participation in local events will also be used to attract new customers.

Furthermore, the business will organize awareness sessions and workshops in schools and universities to educate students about solar energy and its importance. These activities will help build trust, increase public awareness, and create future customer opportunities.

Business Challenges are NOT included
